JForex platform is recommended for traders interested in automated trading and/or developing and testing trading strategies based on the JAVA programming language. The main functionality and interface of the platform are similar to those of Java platform. In addition, a built-in cross-platform interface for execution of custom strategies and programming code are provided. Integrated technical analysis tools also allow to follow positions directly from charts.

In cooperation with Dukascopy, additional information is available at http://www.dukascopy.com/swiss/english/forex/jforex/mt4-jforex_bridge/

- **Different operation systems support!**
You can run automated strategies using any operating system (Windows, Linux, Mac, etc.)
- **Automated strategy visualization!**
JForex provides you with the possibility to visualize a strategy's execution not only during real-time trading but also for historical back tests.
- **Automated strategies based on multiple currency pairs!**
Traders can develop their strategies based on multiple currency pairs. You can also run a historical back test for the selected multiple pairs within one trading strategy.
- **Historical back tests using real tick data!**
In contrast with others automated FX solutions providers in which tests results usually are not

MT4/JForex Clients Bridge

There is a great solution for those who want to trade using the Dukascopy JForex platform whilst taking advantage of the MetaTrader interface and its expert advisors.

MT4-JForex Clients Bridge - is a simple plug-in for the Dukascopy JForex platform. It transfers the trading signals from the Metatrader platform to JForex, receives notifications from MetaTrader log file and executes the transferred trading signals.

Generating new trading signals (Instant Execution or Pending Order), MetaTrader will log it into the file (format yyyyymmdd.log), located in the logs directory where MetaTrader is installed. For JForex this bridge is a standard strategy which reads logs and transfers the trading signals to the JForex platform. JForex users can set up these signals for an automatic execution.

Order modifications, closing and pending orders delete are supported by MT4-JForex Clients Bridge 1.2 version. If a user modifies or closes his orders - the plugin traces it and does the same with orders opened on the Dukascopy JForex platform.

How it works, step by step:

1. To get the bridge, please download the latest version of 'MT4JForexClientsBridge.zip' from <https://sourceforge.net/projects/mt4dukabridge/files/>

Let's start the installation process by downloading the bridge files.

MT4 JForex Clients Bridge Overview and Tutorial

There is a great solution for those who want to trade using the Dukascopy JForex platform of the MetaTrader interface and its expert advisors. MT4-JForex Clients Bridge - is a for the Dukascopy JForex platform. It transfers the trading signals from the MetaTrader receives notifications from MetaTrader log file and executes the transferred trading Generating new trading signals (Instant Execution, Market Order or Pending Order), (format YYYYmmdd.log), located in the logs directory where MetaTrader standard strategy which reads logs and transfers the trading signals to the JForex up these signals for an automatic execution. Orders modification, close and pending orders delete is supported by MT4-JForex Clients modify or close his orders - plugin trace it and do the same with orders opened in

How it works, step by step:

1. To get the bridge, please download the latest version of 'MT4JForexClientsBridge' from <https://sourceforge.net/projects/mt4dukabridge/files/>
2. Unpack the zip archive and copy MT4JForexClientsBridge.java file into ~/My Documents. This is a default folder where JForex platform will search for the strategies.
3. Run the JForex and MetaTrader platforms.
4. In the JForex platform, please subscribe to all instruments you would like to trade as a tree node in the "workspace" menu tree. Then right click on it, for "Open Strategy".
5. If your previous steps were successful, you will find the MT4JForexClientsBridge in the list.
6. JForex platform will open the strategy with its editor. Now you can compile it. If the installation was successful, please run the strategy by pressing the "Run" button (you will be asked to accept the disclaimer before the strategy start).

Version 1.14
1) Parse bug fix - in case of the small line

Version 1.13
1) In cases of slow Response - created a check for SL and TP - delay set operation
2) Fixed bug for buy orders - "Force Execution"

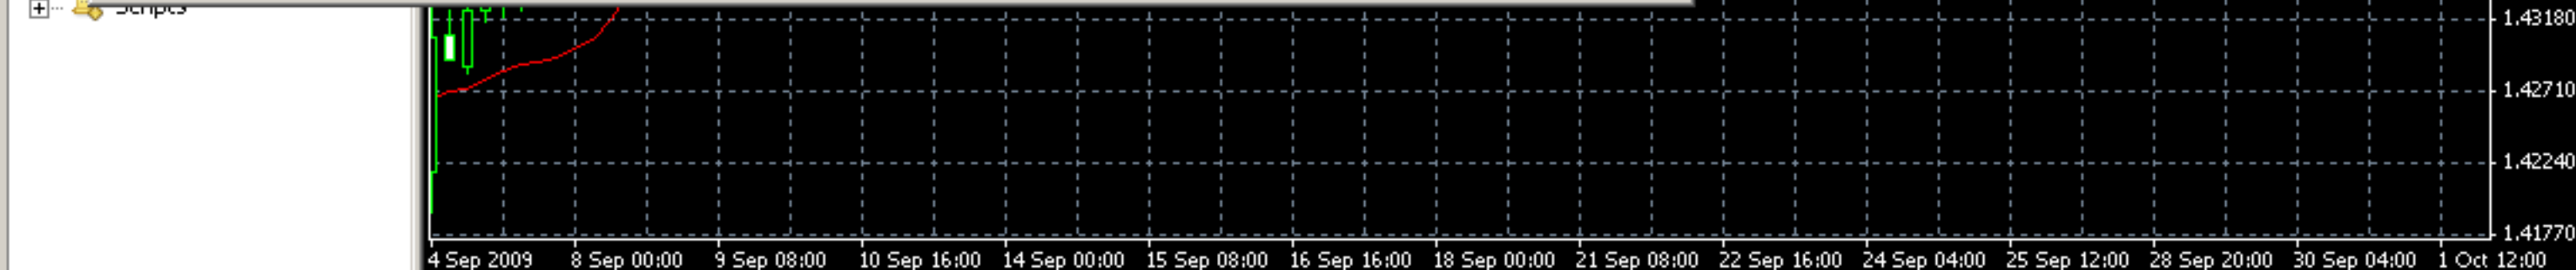

Version 1.12
1) Bug fix in Randomizer
2) GUI improvements
3) Fix - opposite work - "Better price" and "Force Execution"
4) Bug fix - in approve with MetaTrader (repeated values)
5) Better price fix for Pending orders

Version 1.11
1) Bug fix - sometimes the orders signals are duplicated
2) Bug fix - sometimes not random values are produced

Version 1.10
1) Log info is added
2) GUI improvements
3) slippage by default bug is fixed

Version 1.9
1) Bug fix - order close - in some cases orders are not closed
2) Bug fix - StopLoss and TakeProfit order modify if the order was opened in the same
The code was recoded, due that MetaTrader log - the min time of record is seco
3) New feature is added - as option "Always execute (whatever price - all orders becom
to open and close)"

and
"ReleaseNotes".

If you have a Vista and your MetaTrader client was installed into the "Program Files" directory is possible that you will not see the logs in the "logs" folder. this is because Vista prevent user and other programs to use internal files. To solve this problem you can reinstall your MetaTrader in a directory other than "Program Files" or you can disable Vista "User Account Control" system setting.

Some MetaTrader brokers calculate the lot amount not by primary currency (as most brokers do), but always by USD, or any other kind, so be sure that your MetaTrader broker uses classical lot amount.

Lot Amount - In MetaTrader 1 lot usually is equal to 100 000 but in Dukascopy 1 lot is equal to 1 000 000. So, by default the value should be equal to 0.1 – meaning that 1 MetaTrader lot = 0.1 JForex lot. If lot amount in MetaTrader equals = 10 000, the parameter should be 0.01. You will need to set this parameter for each instrument with which you would like to work. (Don't forget that you can always store your settings)

JForex

Time	Type	Instrument	Price
------	------	------------	-------

At the bottom of the tab - the controls and bridge settings - You will see 2 tables - MetaTrader orders and JForex orders, . "Monitor" mode only shows the orders from MetaTrader. "Execute" mode executes new orders in JForex platform.

"Execute at Equal or Better Price" - If you would like to execute only signals (Instant Execution) by equal or better price on JForex, then you can use the checkbox labeled "Execute at Equal or Better Price". Also you can define the "Pips Amount Difference" for this purpose. If you define it as zero, this means that the price can be equal to the MetaTrader price, if you define it to be 2 it means that price in JForex must be better by 2 pips than the price shown on MetaTrader.

"Execute only by MetaTrader Approve" - by default the bridge sends trading signals to JForex directly by MQL strategy request. With this option, the signals will be sent only after MT4 server approval. In that case the speed of signals transfer will be reduced due to delay for MT4 server approval.

Common Favorites

The MetaTrader Client may take some time to process your order. Often the Jforex platform will have the order before MetaTrader creates the order. "signal execution" may speed up order execution on Jforex, but if you prefer execution with MetaTrader approval - you can set the checkbox "Execute only by MetaTrader approve" in the bridge tab. This will make available "parallel" and "faster" execution modes.

☐ Monitor ☒ Execute☒ Execute at Equal or Better PricePips Amount Diff.: ☐ Force Execute for not-Limit Orders☐ Execute only by MetaTrader Approve

MetaTrader

Execute at Equal or Better Price.**Several definitions:**

MetaTrader has 3 different types of orders, some brokers don't support all orders types. Those orders are Instant Execution, Marked Order and Pending Order. This option works only to open orders. In case of Market order this option will not work, because the Market Order does not include a price.

But if you have the option "Execute only by MetaTrader approve" checked, this functionality will work for Market Orders as well. This is because the Bridge works not with Metatrader's signals, but with Orders (In this case execution will be slower and more consistent with MetaTrader).

When you check this option, it that means that the order price from MetaTrader will be compared with the current price from the Dukascopy platform if the Pips Amount Difference is set to zero. If it is not set to zero, the price in Dukascopy will have to be better by that amount in pip value.

Execute at Equal or Better Price - cant be used with Force Execution, due to its opposite functionality.

Monitor Execute

☐ Execute at Equal or Better Price

Pips Amount Diff.: 0

☒ Force Execute for not-Limit Orders☐ Execute only by MetaTrader Approve

MetaTrader

Force Execution.

When you create any orders that are not Limit Orders (without t/p, s/l or slippage) in Dukascopy and it is rejected or cancelled for any reasons, there will be no other attempts to execute the order. But if the order is a Limit order and it is rejected, the Dukascopy platform will try to execute it about 15-30 times, depending on the order. The same happens on order close. When this feature is ON is it possible that your order be executed or closed at a worse price. Use this option with caution.

To Open the order I set the order with max slippage = 20. For Order close, I simultaneously set the takeprofit and stoploss to 200 pips difference from the initial price - to ensure closing.

This feature can be usefull when you need a guaranteed execution on orders other than Limit Orders.

"Execute by MetaTrader approve" - as previously mentioned, this feature changes the way the Bridge operates- it will ignore user's and strategy trade signals and only respond on MetaTrader server created orders and closing orders. This feature makes JForex more synchronized with MetaTrader, but may decrease the profit, due to the slower response - namely because the response from MetaTrader can take some time.

MetaTrader writes his log according to the computer's local time. The Bridge works the same way. It is highly recommended to avoid changing the computer's local time, as it can create unknown problems.
