

Position should have been opened right here (according to a doji on the lower time frame).

Sometimes positions are opened too late. Once the time frame is changed, the strategy often ignores dojis during the time set aside for opening a position. But if a doji occurs after this time, a position is opened by the strategy.

The above position was opened after a 10sec-doji, but this doji is located between the wrong BBands – it needs to be between lower and middle BBand.

The conditions in the strategy say, that there have to be four **red** candles. How could a position be opened after two green candles?

At first a position was opened without a crossing of the middle BBand. And afterwards a position was opened after just one red candle and again without a crossing of the middle BBand.

The opening of this position came too late. It should have been in the previous 1min candle.
